CC The present sequence encodes a recombinant single chain peptide,

CC SF11-scFv. The peptide is an antibody construct comprising the variable

CC SF11-scFv. The peptide is an antibody construct comprising the variable

CC cregions of the heavy and light chains of an antibody against

CC distaloganglisside (GD2) as a single chain Fv fragment (scFv). GD2 occurs

CC in many tumours types including neuroblastoma, osteosarcomas and other

CC soft tissue sarcomas, medulloblastomas, high grade astrocytomas,

CC melanomas and small cell lung cancer. The peptide can be detectably

CC distaloganglisside (GD1) as a toxin, streptavidin or a pro-drug

CC GD2. It can also be used to target delivery of a therapeutic or

CC converting enzyme, to cells expressing GD2. The peptide may further

CC comprise CD8 to facilitate the formation of GD2-targeted lymphocytes.
                                                                                                                                                                                                                                                                                                                                                                                                   Matches

CC Disclosure; Page 12; 31pp; English.

CC The present sequence encodes a recombinant single chain peptide, comparising the variable regions of the heavy and light chains of an antibody against comparising comparisity through the heavy and light chains of an antibody against comparisity through the present including neuroblastoma, osteosarcomas and other comparisity through the present such as a single chain Fv fragment (scFv). GD2 occurs in many tumours types including neuroblastoma, osteosarcomas and other comparison medulloblastomas, high grade astrocytomas, comparison that tissue sarcovates and other comparison to target delivery of a therapeutic or comparison to target delivery of a therapeutic or comparison to target delivery of a therapeutic or peptide may further comparise CD8 to facilitate the formation of comparison c

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Submitted (18-JUL-1995) Andrew D. Farmer, HIV Sequence Database, Los Alamos National Labroatory, T-10, Mail Stop K710, Los Alamos, NM 87501, USA

HPV22 was originally isolated from macules on the chest of an Italian epidermodysplasia verruciformis (EV) patient [2]. The HPV22 genome, like that of HPV9 9, 15, 17a/b, 23, 37, 38, is smaller than most PV genomes at approximately 7.4 kb. Phylogenetic reconstructions based on DNA sequences of established types indicate that HPV22 is most closely related to HPVs 23 and 38, and then to 15, 17, 37 and 9. Although Kremsdorf et al [2] found substantial cross-hybridization between HPV22 and HPV19, nucleotide sequence comparison fails to support a close relationship between these two topes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      two

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Inhibition of proliferation or survival of, esp. malignant erbB2, reells - by introducing nucleic acid mol. encoding antibody homologue which is expressed and binds, pref. erbB2, protein intracellularly claim 42; Page 29-30; 48pp; English.

A nucleic acid comprises a first sequence encoding a signal peptide (R94019) linked to a second sequence (T17728) encoding a single chain Fv fragment (R94020) that binds a human erbB2 oncoprotein. The anti-erbB2 sFv portion is obtained by PCR using e23scFv plasmid as template. The signal peptide directs the scFv to the endoplasmic reticulum. The nucleic acid is incorporated into a plasmid or viral vector to facilitate expression of the scFv antibody expression of the homologue within e.g. an epithelial carcinoma cell. Intracellular expression of the homologue inhibits surface expression of erbB2 and thereby inhibits cell proliferation and cell survival and decreases

The present cDNA sequence codes for a calined single-chain antibody, cdesignated e23(FV), which binds to erbB-2. Monoclonal antibody e23 was generated by immunising mice with N/erbB-2 cells overexpressing the gpl85 protein, removing spleen cells and producing hybridomas by standard techniques. Messenger RNA coding for the anti-erbB-2 monoclonal antibody was isolated and converted to cDNA. Regions coding for the heavy- and light- chain variable regions were then amplified by PCR and joined via a sequence encoding a peptide linker. The resulting single-chain antibody is useful for in vitro diagnosis of tumour cells which overexpress the erbB-2 gpl85 marker, e.g. breast, ovarian and non-small cell lung carcinomas, and, when coupled to a cytotoxic agent, to treat such tumours. Disclosure; Fig 1; 73pp; English.

The sequence encodes Qm212, a single chain antigen binding protein having a metal binding site which is derived from the 4-4-20/212 protein (Bird et al., Science, 242:423-426 [1988]), Qm212 differs from 4-4-20/212 by amino acid substitutions at residue positions 60, 62, 115 and 117 to provide for contact amino acid residues, where three of these contact residues form a metal binding site. The organism form which the gene originated is not given in the specification. The protein may be used to selectively partition and/or remove metal cations from fluids. Preselected antigens can be used to remove metal protein complexes from a liquid phase or as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  from a cysteine to a serine. The hinge regions were added by introduction of a BstE II restriction site in the 3'-terminus of the gene encoding the 4-4-20/212 single-chain antigen-bind

The present cDNA sequence codes for a claimed single-chain antibody e21 designated e21(FV), which binds to erbB-2. Monoclonal antibody e21 was generated by immunising mice with N/erbB-2 cells overexpressing the gpl85 protein, removing spleen cells and producing hybridomas by standard techniques. Messenger RNA coding for the anti-erbB-2 monoclonal antibody was isolated and converted to cDNA. Regions coding for the heavy- and light- chain variable regions were then amplified by PCR and joined via a sequence encoding a peptide linker. The resulting single-chain antibody is useful for in vitro diagnosis of tumour cells which overexpress the erbB-2 gpl85 markers of breat extrapolations and the code of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Q55181 :

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         targetting cytotoxic agents or enzymes to tumour cells
Example; Fig 10A; 118pp; English.

"4-4-20 VL" means the variable region of the light chain of the
4-4-20 mouse monoclonal antibody (Bird, R.E. et al., Science 242:423
(1988)). The number "212" refers to a specific 14-residue
polypeptide linker that links the 4-4-20 VL and the CC49 VH. See
Bedzyk, W.D. et al., J. Biol. Chem. 265:18615-18620 (1990). "CC49 VH"
is the variable region of the heavy chain of the CC49 antibody,
which binds to the TAG-72 antigen.

In the design for the hinge region, the C-terminal serine in the 4-4-20/212 singl-chain antigen-binding protein was made the first serine of the hinge and the second residue of the hinge was change from a cysteine to a serine. The hinge regions were added by introduction of a BstE II restriction site in the 3'-terminus of the gene encoding the 4-4-20/212 single-chain antigen-binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New multivalent antigen-binding protein e.g. contg. CC49 Mab regions - useful in diagnosis, for destroying blood clots and targetting cytotoxic agents or enzymes to tumour cells example; Fig 15B; 118pp; English.

Erree cysteines were engineered into the C-terminal of the Free cysteines were engineered into the C-terminal of the 4-4-20/212 single-chain antigen-binding protein, in order to chemically crosslink the protein. The design was based on the hinge region found in antibodies between the CH1 and CH2 regions.

                                                                                                                                                                                                                                                                              Oligonucleotide; DNA probe; n
             Oligonucleotide probe MK14-A consists of nucleotides 5-95 of (Q51735). It hybridized to all spp. of mycobacteria tested, cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cds

                                                                                                                                                                                                        New multivalent antigen-binding protein e.g. contg. CC49 Mab regions - useful in diagnosis, for destroying blood clots and targetting cytotoxic agents or enzymes to tumour cells Example; Fig 10B; 11Bpp; English.

"4-4-20 WH" means the variable region of the heavy chain of the 4-4-20 mouse monoclonal antibody (Bird, R.E. et al., Science 242:423 (1988)). The number "212" refers to a specific 14-residue polypeptide linker that links the 4-4-20 WH and the CC49 VL. See Bedzyk, W.D. et al., J. Biol. Chem. 265:18615-18620 (1990). "CC49 VL" is the variable region of the light chain of the CC49 antibody, which binds to the TAG-72 antigen.

                                                                                                                                                                                        New antigen binding proteins contg. immunoeffector or cytolytic peptide - attached to variable regions of antibody light or heavy or chain, useful in diagnosis and in destroying cancer cells Example 1; Fig 4A-B; 72pp; English.

A novel DNA construct (T29058) codes for a single-chain antigenbinding fusion protein (R97380) comprising the light chain variable region (VL) of monoclonal antibody CC49 linked to the CC49 VH region via a spacer peptide (R97379), with a C-terminal phospholipase A activating protein (PLAP) immunoeffector peptide (R97388). It was obtd. by ligating a synthetic PLAP fragment to an existing CC49/212 gene, and can be used to produce the fusion protein in transformed host cells. The fusion protein combines immunoeffector function of PLAP.

Oligonucleotide probe MK14-A consists of nucleotides 5-95 of (Q51735). It hybridized to all spp. of mycobacteria tested, cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. See also Q51735-45 and Q51747-59.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antigen binding proteins contg. immunoeffector or cytolytic peptide - attached to variable regions of antibody light or heavy chain, useful in diagnosis and in destroying cancer cells Disclosure; Page 39-40; 72pp; English.

A novel DNA construct (729059) codes for a single-chain antigen binding fusion protein (R97381) comprising the light chain variable region (VL) of monoclonal antibody CC49 linked to the CC49 VH region via a spacer peptide (R97379) and with an N-terminal phospholipase A activating protein (PLAP) immunoeffector peptide (R97368). It can be used to produce the fusion protein in transformed host cells. The fusion protein combines the tumour antigen-binding capability of CC49 with the immunoeffector function of PLAP.
